

COMP 3331/9331: Computer Networks and Applications

Week 6

Network Layer: Data Plane

Reading Guide: Chapter 4: Sections 4.1

Network Layer: outline

Our goals:

- understand principles behind network layer services, focusing on data plane:
 - network layer service models
 - forwarding versus routing
- instantiation, implementation in the Internet

Network Layer, data plane: outline

4.1 Overview of Network layer

- data plane
- control plane

4.2 What's inside a router

- Not Covered

4.3 IP: Internet Protocol

- datagram format
- fragmentation
- IPv4 addressing
- network address translation
- IPv6

4.4 Generalized forwarding and Software Defined Networking (SDN)

- Not Covered

Some Background

- 1968: DARPAnet/ARPAnet (precursor to Internet)
 - (Defense) Advanced Research Projects Agency Network
- Mid 1970's: new networks emerge
 - SATNet, Packet Radio, Ethernet
 - All “islands” to themselves – didn't work together
- Big question: How to connect these networks?

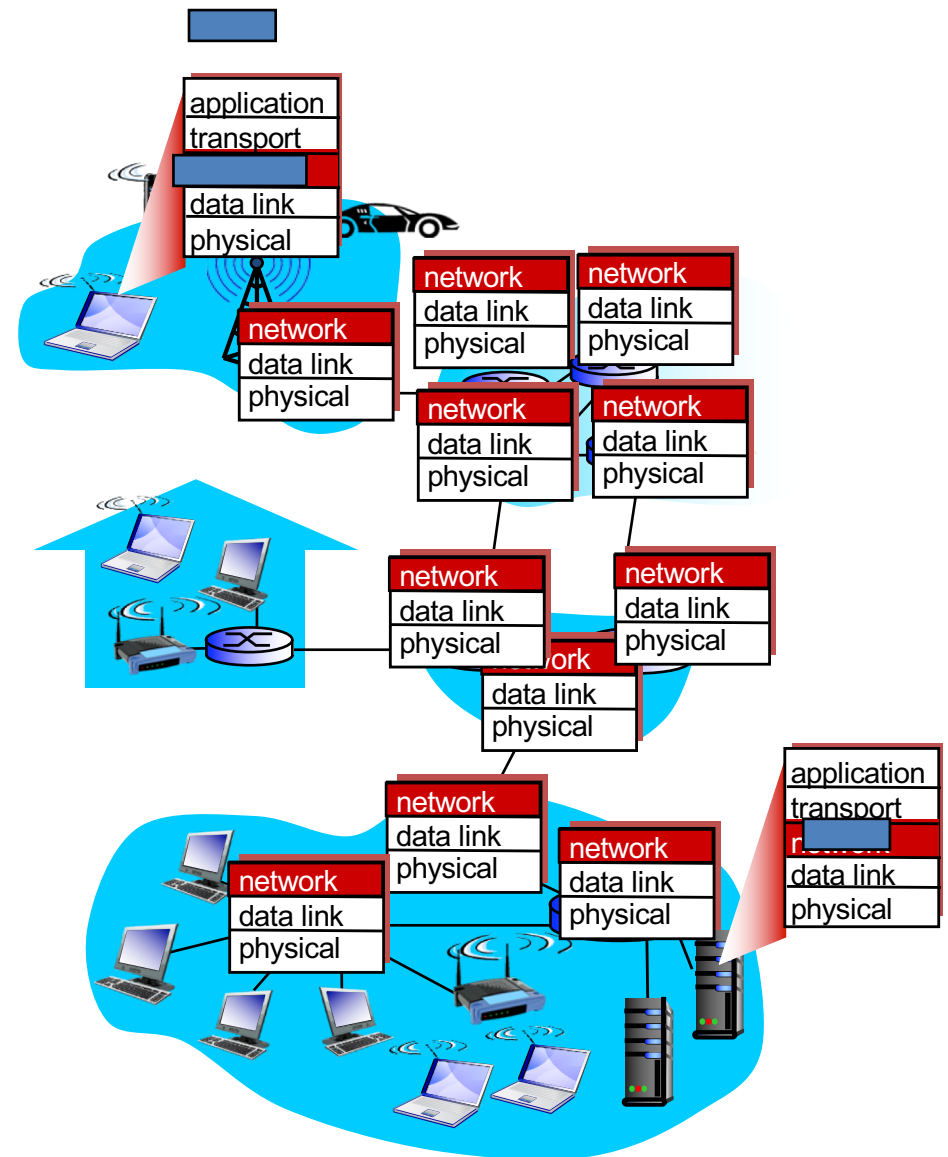

Internetworking

- Cerf & Kahn in 1974,
 - “A Protocol for Packet Network Intercommunication”
 - Foundation for the modern Internet
- **Routers** forward **packets** from source to destination
 - May cross many separate networks along the way
- All packets use a common **Internet Protocol**
 - Any underlying data link protocol
 - Any higher layer transport protocol

Network Layer

- transport segment from sending to receiving host
- on sending side encapsulates segments into datagrams
- on receiving side, delivers segments to transport layer
- network layer protocols in *every* host, router
- router examines header fields in all IP datagrams passing through it

Two key network-layer functions

- *forwarding*: move packets from router's input to appropriate router output
- *routing*: determine route taken by packets from source to dest.
 - *routing algorithms*

analogy:

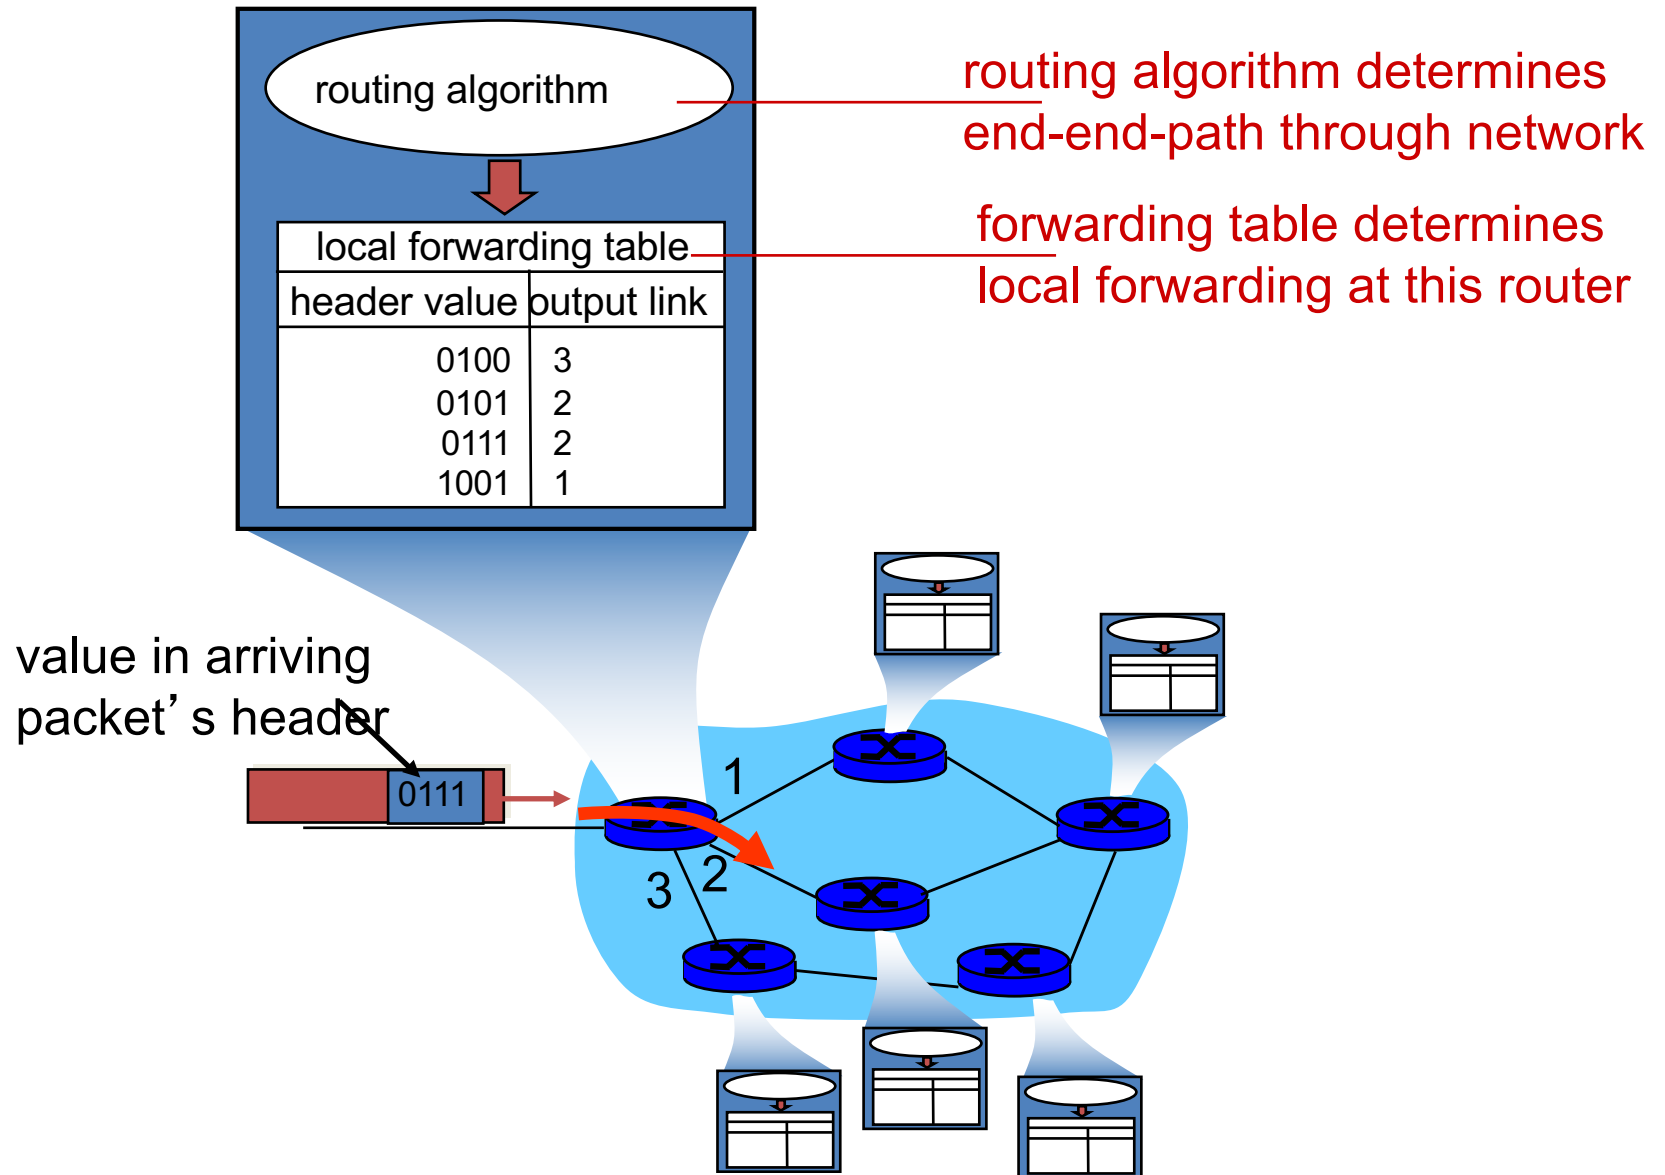

- ❖ *routing*: process of planning trip from source to dest
- ❖ *forwarding*: process of getting through single interchange

When should a router perform routing? And forwarding ?

- A: Do both when a packet arrives
- B: Route in advance, forward when a packet arrives
- C: Forward in advance, route when a packet arrives
- D: Do both in advance
- E: Some other combination

Interplay between routing and forwarding

Network Layer: data vs control plane

Data plane

- local, per-router function
- determines how datagram arriving on router input port is forwarded to router output port
- forwarding function

values in arriving packet header

Control plane

- network-wide logic
- determines how datagram is routed among routers along end-end path from source host to destination host
- two control-plane approaches:
 - *traditional routing algorithms*: implemented in routers
 - *software-defined networking (SDN)*: centralised (remote) servers

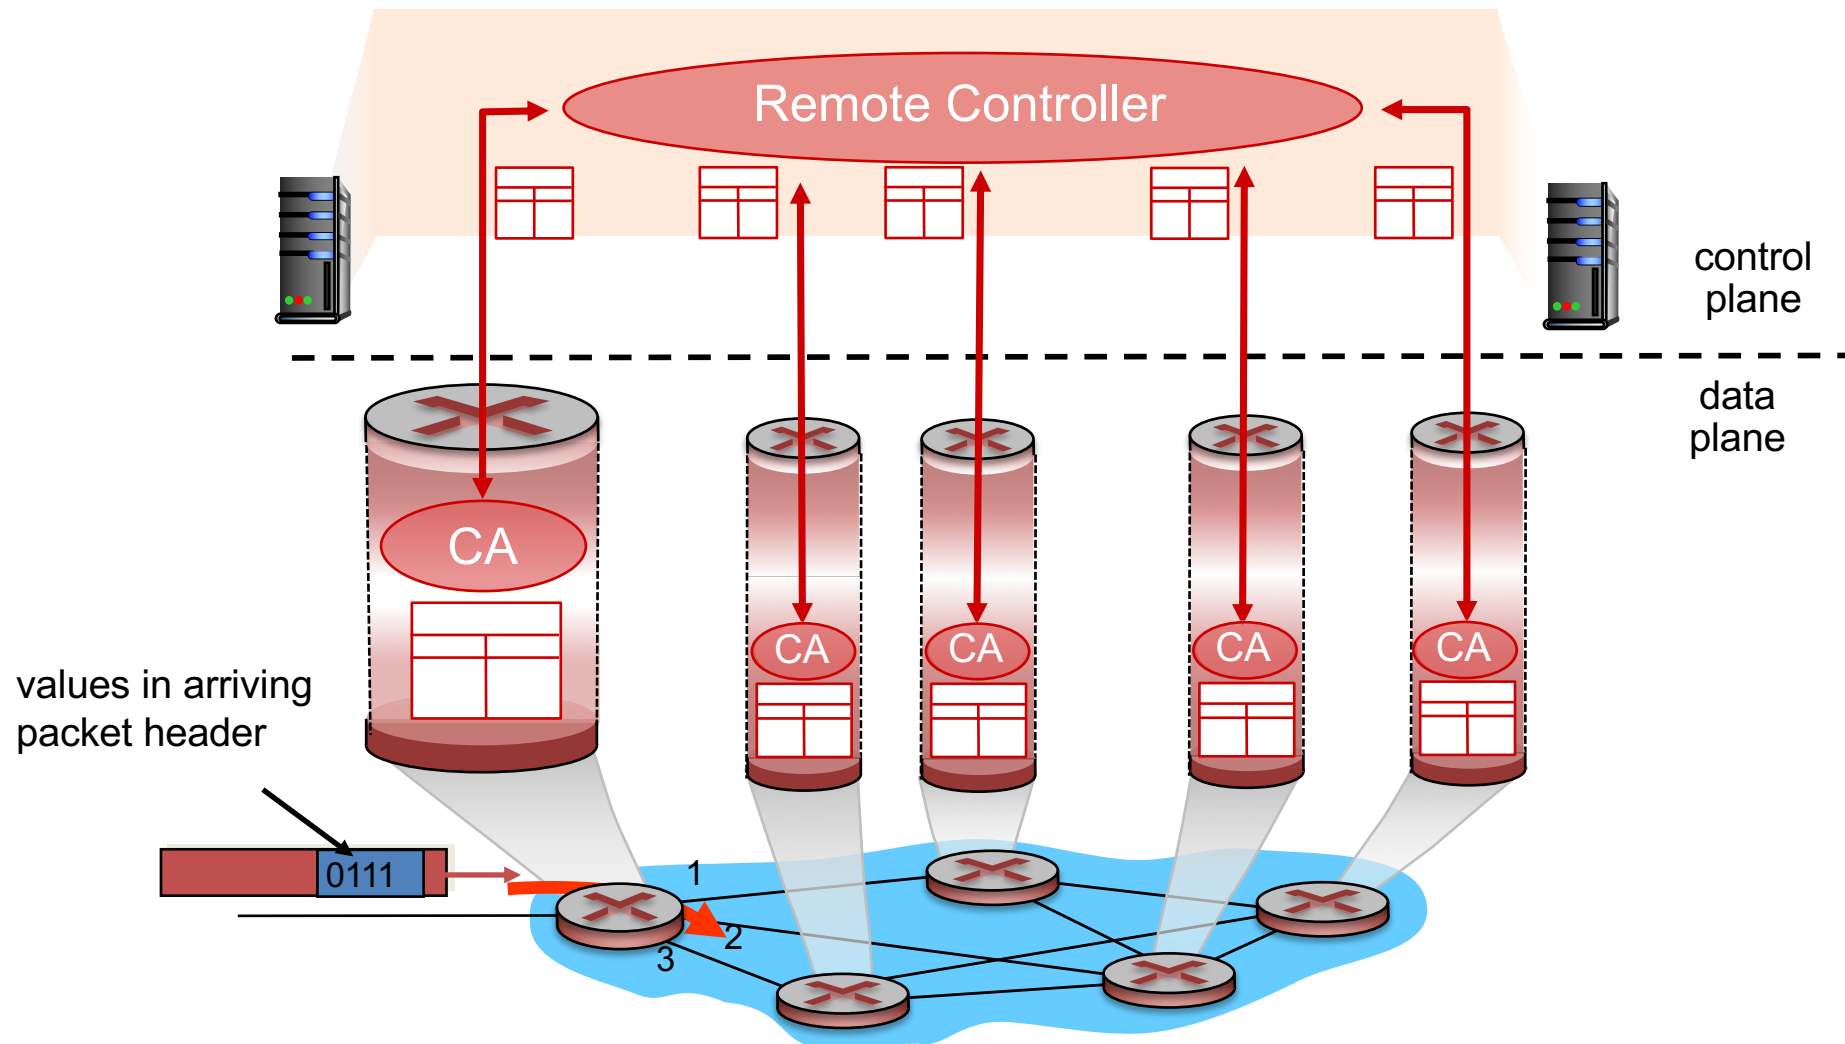

Per-router control plane

Individual routing algorithm components *in each and every router* interact in the control plane

Logically centralized control plane (SDN)

A distinct (typically remote) controller interacts with local control agents (CAs)

Network Layer: service model

Q: What *service model* for “channel” transporting datagrams from sender to receiver?

A. No guarantee whatsoever is provided by IP layer in TCP/IP protocol stack. It’s “best effort service”.
